**Methodology Run on 06/05/2023**  
Data Source: Data obtained from Florida Department of Health: <http://www.flhealthcharts.com/FLQUERY/Population/PopulationRpt.aspx> (Column D). Data also obtained from Substance Abuse and Mental Health Services Administration, 2021 NSDUH Model-Based Prevalence Estimates (50 States and the District of Columbia) (Columns E, G, J), [https://www.samhsa.gov/data/sites/default/files/reports/rpt39465/2021NSDUHPercents\\_ExcelTabsCSVs110322/2021NSDUHsaePercentsTabs110322.pdf](https://www.samhsa.gov/data/sites/default/files/reports/rpt39465/2021NSDUHPercents_ExcelTabsCSVs110322/2021NSDUHsaePercentsTabs110322.pdf).  
Unmet treatment need < 340 does not require a full clinic (based on smallest full clinic census at 348)  
The average clinic capacity (ACC) in full clinics (34,903/62 full clinics) = 562 individuals per clinic (rounded to 560). This was used to establish the number of clinics needed.

Note: Florida’s 2019-2020 substate level data is unavailable, due to a retraction of data because of lack of confidence in data collected during the COVID-19 Pandemic. The 2022-2023 OTP Needs Assessment uses the most recently published National Survey on Drug Use and Health (NSDUH) state estimates. These estimates present the United States’ state estimates for 15 measures of substance use and mental illness based on combined 2021 NSDUH data (Column E and G). Florida Population estimates for 2021 are provisional numbers pulled 06/05/2023 (Column D).  
Substate Estimates of Substance Use and Mental Illness from the 2018-2020 NSDUH: Results and Detailed Tables  
Substate estimates for these years are no longer available due to methodological concerns with combining 2020 data with data from 2018 and 2019. We apologize for any inconvenience or confusion this may cause.  
To protect the safety of field staff and survey participants during the COVID-19 pandemic, SAMHSA decided to suspend in-person NSDUH data collection on March 16, 2020. To reduce the impact of the COVID-19 pandemic on NSDUH data, SAMHSA approved the addition of web-based data collection, and in Quarter 4 of 2020 (i.e., October to December), it became the primary forms of NSDUH data collection. Conventional in-person data collection was carried out wherever it was considered safe to do so based on county- and state-level COVID-19 metrics; however, in the fourth quarter of 2020, most respondents answered the survey via the web. Because of the various demographic groups participating in the survey, and the fact that individuals approach the questions differently depending on the context of the question, it is known that people may respond to the survey differently while taking it in-person versus online. Thus, introducing what is called a mode effect.  
The potential for a mode effect to affect comparisons and trends between 2018 and 2020 was known when the state estimates were published. However, the initial assumption was that the mode effect was similar for different groups of people, so calculating the average across 2018-2020 would produce statistically valid results. Further analyses that included data from the 2021 NSDUH has shown that this assumption cannot be made. Because of these analyses, along with concerns about the rapid societal changes in 2020, it was determined that averages across the three years maybe misleading. Therefore, as explained above, the substate estimates for 2018-2020 are no longer provided.  
\*\* Number of new clinics was determined by Dividing the unmet need not addressed by the remaining capacity in existing clinics by the average capacity of clinics, OR if the amount of unmet need in a county exceeds 60 individuals
